                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               diagnosis
```

Example 2; SEQ ID NO 3112; 781pp + Sequence Listing; English.

The invention relates to novel genes (AAL34669-AAL37666) and proteins (ABB03087-ABB04109) associated with the musculoskeletal system useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The mucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and cher cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases such as wiral, bacterial, fungal and parasitic infections diseases such as viral, bacterial, fungal and parasitic infections.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at ftp.Wipo.int/pub/published_pot_sequences.

The invention describes an isolated nucleic acid molecule comprising a agequence encoding musulloskeletal system associated polypeptides useful for detecting disorders, e.g., cancer or cancer metatrases, in animals or humans. The nucleic acid: stimulates re-vascularisation of ischaemic tissues associated with conditions such as thrombosis, arteriossclerosis, and other cardiovascular conditions; treats wounds due to injuries, burns, post-operative tissue repair, and ulcers; stimulates angiogenesis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Isolated nucleic acid molecules encoding musculoskeletal system associated polypeptides, useful for detecting disorders, e.g. cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       English

Homo sapiens

Hereditary haemochromatosis gene.

14-APR-1998 (first entry)

```
conditions, such as, Alzheimer's dieease, barkinson's dieease, and AIDS-related complex; stimulates chondrocyte growth, thus they can be used to enhance bone and periodontal regeneration and aid in tissue transports or bone grafts; prevents skin aging due to sumburn by transports or bone grafts; prevents skin aging due to sumburn by stimulating keratinocyte growth; prevents hair loss, since FGF family stimulates activate hair-forming cells and promotes melanocyte growth; stimulates growth and differentiation of hematopoietic cells and bone marrow cells when used in combination with other cytokines; maintains crgans before transplantation or for supporting cell culture of primary tissues; induces tissue of mesodermal origin to differentiate in early embryons; increases or decreases the differentiation or proliferation of embryonic stem cells, besides, haematopoietic lineage; modulates mammalian characteristics, such as, body height, weight, hair colour, eye colour, skin, percentage of adipose tissue, pigmentation, size, and shape colour, skin, percentage of adipose tissue, pigmentation, size, and shape mammal's metal state or physical state by influencing biorhythms, caricadic rhythms, depression, tendency for violence, tolerance for pain, reproductive capabilities, hormonal or endocrine levels, appetite, libido, memory, or stress; increases or decreases storage capabilities, content, lipid, protein, carbohydrate, vitamins, minerals, cofactors or other nutritional components. This sequence encodes a novel human content.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1784

Hereditary haemochromatosis gene and variants - useful for diagnosis and treatment of hereditary haemochromatosis disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         mutated form is associated with hereditary haemochromatosis (HH). To identify this novel gene, allelic association patterns were determined between known markers and the HH locus in the HLA region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      of chromosome 6. A physical clone coverage was then generated extending from D6S265, which is a marker that is centromeric of HIA-A, in a telomeric direction through D6S276, a marker at which
                                                                                                                                                                                                                                                                                                                                                                              "G to A substitution (24d1 mutation associated with HH), results in Cys to Tyr substitution"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This genomic DNA sequence corresponds to the human gene whose

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to hereditary hemochromatosis gene products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        5606 TGCCTCCTTTGGTGAAGGTGACACATCATGTGACCTCTTCAGTGACCACTCTACGGTGTC

The present invention describes hereditary haemochromatosis gene products from the human haemochromatosis gene. The present sequence crepresents a hereditary haemochromatosis (HH). Also described is a unaffected by hereditary haemochromatosis (HH). Also described is a method to determine the presence or absence of the common hereditary haemochromatosis (HFE) gene mutation in an individual comprising:

(a) providing DNA or RNA from the individual; and (b) assessing the DNA or RNA for the presence or absence of a haplotype or genotype where the presence or absence of the haplotype genotype indicates the likely products for the HFE gene mutation in the genome of the individual. The HFE gene sequences from the present invention can be used to develop products for use in the diagnosis and treatment of HFE. The present invention also describes BTF genes, which are homologues of the milk protein butyrophilin (BT), and can be used in the production of agonists and antagonists of BT function. Also described are: (1) a RoRet gene which can be used to develop products for the study, diagnosis and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to hereditary hemochromatosis gene products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.

                                                                                                                             The present invention relates to hereditary hemochromatosis gene products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  241 ACCCAGGCCTGGATCAGCCCCTCATTGTGATCTGGGGTATGTGACTGATGAGAGCCAGGA

                                                                                                                                                                                                                                         The present invention relates to hereditary hemochromatosis gene products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cal differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.

method to determine the presence or absence of the common hereditary haemochromatosis (HFB) gene mutation in an individual comprising:

(a) providing DNA or RNA from the individual; and (b) assessing the DNA or RNA for the presence or absence of a haplotype or genotype where the presence of the haplotype genotype indicates the likely presence of the HFB gene mutation in the genomy of the individual. The HFB gene sequences from the present invention can be used to develop products for use in the diagnosis and treatment of HFB. The present invention also describes BFF genes which are homologues of the milk protein butyrophilin (BT), and can be used in the production of agonists and antagonists of BT function. Also described are: (1) a ROREt gene which are homologues of a type 1 sodium transport gene, and can can be used to develop.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       41496 TGCCTCCTTTGGTGAAGGTGACACATCATGTGACCTCTTCAGTGACCACTCTACGGTGTC 41437
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  41436 GGGCCTTGAACTACCCCCAGAACATCACCATGAAGTGGCTGAAGGATAAGCAGCCAA 41377

These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Wolff RK;

```
The present invention relates to hereditary hemochromatosis gene products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.

The specification describes a method for the biological preparation of a stably encapsulated reference nucleic acid for molecular diagnostic and genetic testing. The method comprises inserting a vector containing a

The invention relates to a soluble polypeptide (I) of beta 2

microglobulin (beta2m)/HFE monochain comprising human beta2m (or its

microglobulin (beta2m)/HFE monochain comprising human beta2m (or its

malogue or active fragment). Linked to alphal-alphal domains of human

HFE (a central regulator of iron absorption; undefined) or its analogue

or active fragment, by a flexible linker peptide, or a functional

ederivative or salt of (I). (I) is useful for reducing intracellular iron

absorption in patients having hereditary haemochromatosis, transfusions,

thalassaemias, haemolytic anaemia or chronic infections, and for

chain barrier. (I) is further useful for treating transfusions,

cc delivering a therapeutic to cells that over-express transferrin receptor

(TfR) which are preferably lymphocytes or leukocytes, across the blood-

brain barrier. (I) is further useful for treating brain tumour. (I)

cc is also useful for treating oxidative stress disorders resulting in

ct issue damage e.g. vascular diseases, inflammation, atherosclerosis,

cut sommune diseases and inflammatory conditions. The monochain manifests

autoimmune diseases and inflammatory conditions. The monochain manifests

cs pecific characteristics advantageous for drug delivery systems. It is a

specific characteristics advantageous for drug delivery systems. It is a

csoluble, stable and fully conformed protein. It binds specifically to

cransferrin receptor (TfR) and therefore targets cells that over-express

cc slubling efficient drug delivery. It dissociates from the receptor,

cells, minimising side effects. It negatively regulates iron absorption,

reducing growth of undesired cells and preventing lymphocyte activation.

ccells, minimising side effects. It negatively regulates iron absorption,

reducing yrowth of undesired cells and preventing lymphocyte activation.

ccells, minimising side effects it is a self non-polymeric protein and delivery of

charges via monochain is expected to overcome drug-resistance since it is a

Hereditary haemochromatosis gene and variants - useful for diagnosis and treatment of hereditary haemochromatosis disease P-PSDB; AAW36499

WPI; 1997-512743/47.

This cDNA clone, designated cDNA24, is derived from human gene whose mutated form is associated with hereditary haemochromatosis (HH). It was obtained from a directionally cloned plasmid-based cDNA library following identification of the HH locus in the HLA region of chromosome . A single mutation (24d1) in the HH gene responsible for the majority of HH disease. This comprises a G to A substitution that is present in 86% of affected chromosomes and in 4% of unaffected chromosomes. It results in a chromism and in the encoded protein (see AM36499) at a critical disulphide bridge important for secondary structure. The following are claimed: a 10825 bp genomic DNA sequence (I) (see following are claimed: a 10825 bp genomic DNA sequence (I) (see following are claimed: a cloning or expression vector; host cells; a special product chosen from the HH gene product, its variants credices for the HH gene product chosen from the HH gene product is search and 24d7, 24d2 and 24d7, or a peptide of at least 56 amino acid residues of these sence or absence of the common HH gene condetermine the presence or absence of the common HH gene condetermine the presence or absence of the common HH gene condetermine the presence or absence of the common HH gene mutation; an annimal medal for the HH disease; metal agents for the mitigation of injury due to oxidative process in vivo or mitigation of iron overload; a method for screening potential Disclosure; Fig 4; 115pp; English.

therapeutic agents for activity in connection with HH disease, an antisense oligonucleotide directed against a transcriptional product of anucleic acid sequence as above, and oligonucleotides or pairs of oligonucleotides covering a range of nucleotides from (I), (Ia) or their variants, useful for detecting a polymorphism in the HH gene. The invention also relates to methods for screening for HH homozygotes, to HH diagnosis, prenatal screening and diagnosis, and therapies of HH disease, including gene therapy, protein—and antibody-based therapeutics, and small molecule
                                                                                                                                                                                                                                                                                                                                                    0
